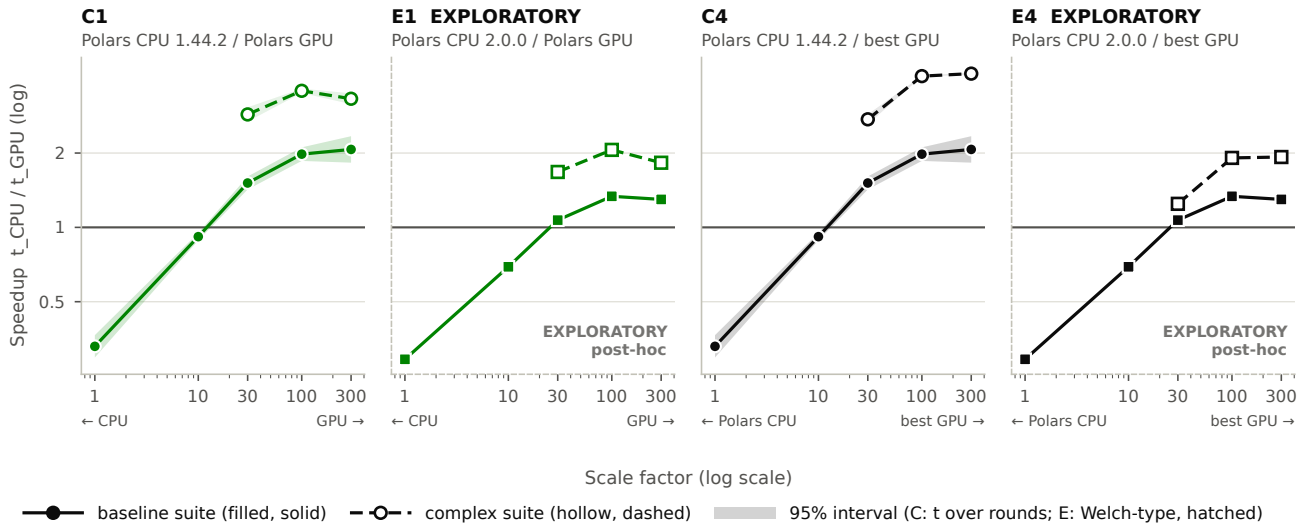
Locked-design C1 and C4 beside the EXPLORATORY E1 and E4 (post-hoc; not in the locked design §9): suite-level speedup by scale



E1 and E4 are exploratory (post-hoc; not in the locked design §9): the CPU side is the 2.0.0 side-study sessions and the GPU side the main rounds, unpaired sessions from different rounds, so their bands are Welch-type 95% intervals on the log scale (df from Welch-Satterthwaite). C1 and C4 are the locked-design contrasts with Polars 1.44.2 on the CPU side (t-interval over rounds, df = rounds − 1). E1 and E4 are not used by the crossover verdict or any other primary output.
