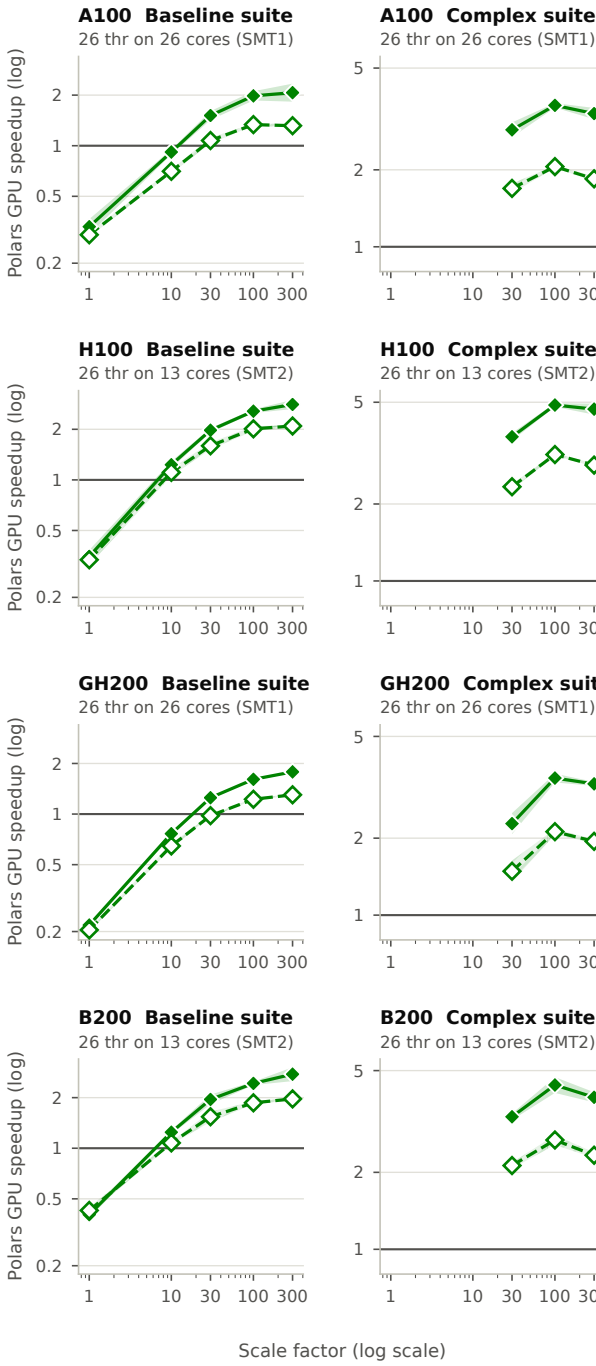
Polars GPU speedup against two CPU baselines, by host: exploratory (post-hoc); E1 is not in the locked design §9



C1 (solid, filled): Polars CPU 1.44.2 / Polars GPU, the locked-design contrast of the host's own campaign, 95% t-interval over rounds. E1 (dashed, hollow): Polars CPU 2.0.0 (side-study sessions) / Polars GPU (main rounds), unpaired sessions so a Welch-type 95% interval on the log scale. Above 1 the GPU is faster. Where a host's side study (the Polars 2.0.0 bridge) is not available, only C1 is drawn and the panel says so. E1 is exploratory (post-hoc; not in the locked design §9). Under each host: the --cpus threads and the physical cores they can occupy (lscpu).
