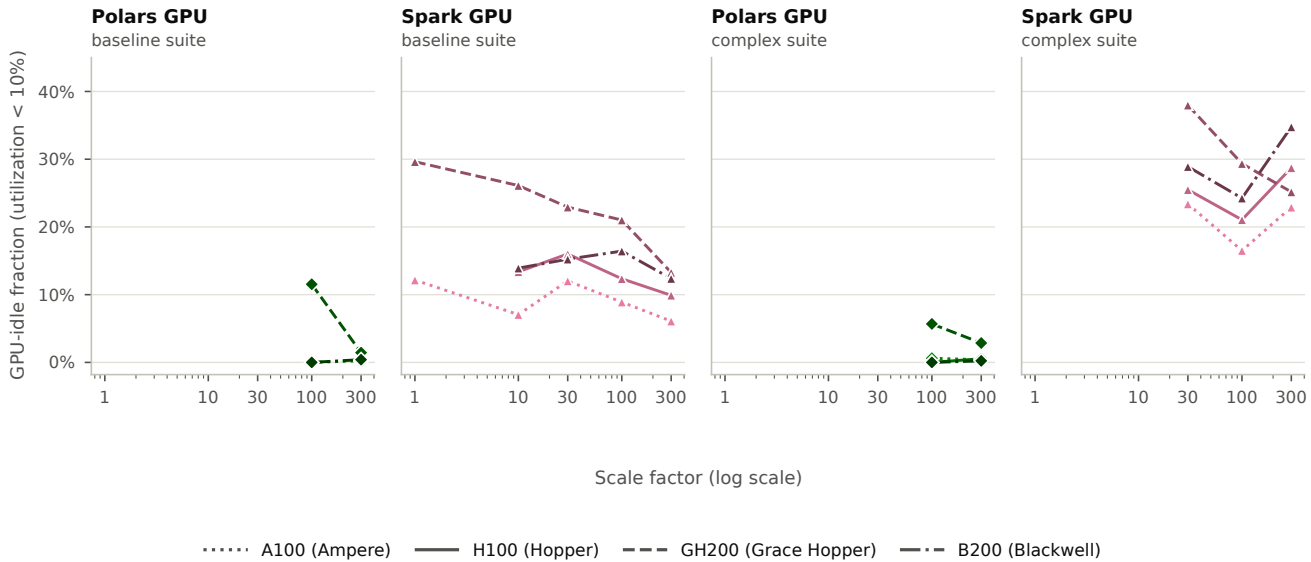
GPU-idle fraction during measured actions by scale and host (descriptive telemetry; not a pre-registered contrast; no causal claim)



GPU-idle fraction: share of nvidia-smi samples (about every 200 ms) with utilization.gpu below 10% inside measured actions of at least 1 s; shorter actions (most SF1 actions and the short Polars GPU actions at small scales) are left out, so a missing point means no action of that cell reached 1 s. nvidia-smi's utilization.gpu is the share of the sample period in which a kernel was executing, not SM occupancy. Hosts are separate campaigns with different CPUs, drivers and memory; descriptive, no causal reading.
